Citation Requirement	
Publications and research reports based on the IPUMS USA database must cite it appropriately. The citation should include the following: Steven Ruggles, Sarah Flood, Matthew Sobek, Daniel Backman, Grace Cooper, Julia A. Rivera Drew, Stephanie Richards, Renae Rodgers, Jonathan Schroeder, and Kari C.W. Williams. IPUMS USA: Version 16.0 [dataset]. Minneapolis, MN: IPUMS, 2025. https://doi.org/10.18128/D010.V16.0 The licensing agreement for use of IPUMS USA data requires that users supply us with the title and full citation for any publications, research reports, or educational materials making use of the data or documentation. Please add your citation to the IPUMS bibliography at http://bibliography.ipums.org/.	
Conditions	
Users of IPUMS USA data must agree to abide by the conditions of use. A user's license is valid for one year and may be renewed. Users must agree to the following conditions: (1) No fees may be charged for use or distribution of the data. (2) Cite IPUMS appropriately. For information on proper citation, refer to the citation requirement section of this DDI document. (3) Tell us about any work you do using the IPUMS. Publications, research reports, or presentations making use of IPUMS USA should be added to our Bibliography. Continued funding for the IPUMS depends on our ability to show our sponsor agencies that researchers are using the data for productive purposes. (4) The IPUMS cannot be used for genealogical research (5) It is difficult to use the IPUMS to study small geographic areas. In the IPUMS census samples for years 1940-present, no places having a population of fewer than 100,000 persons can be identified. (6) Use it for GOOD -- never for EVIL. (7) Please notify ipums@umn.edu regarding errors in the data or documentation.	
Disclaimer	
The user of the data acknowledges that the original collector of the data, the authorized distributor of the data, and the relevant funding agency bear no responsibility for use of the data or for interpretations or inferences based upon such uses.

§ 3. File Description**File**

File Name:	usa_00084.dat
Contents of Files:	Microdata records
Type:	rectangular
File Type:	ISO-8859-1 data file
Data Format:	fixed length fields
Place of File Production:	IPUMS, 50 Willey Hall, 225 - 19th Avenue South, Minneapolis, MN 55455

§ 4. Variable Description**Jump to Variable**

1. [YEAR](#) (Census year)
2. [SAMPLE](#) (IPUMS sample identifier)
3. [SERIAL](#) (Household serial number)
4. [NUMPREC](#) (Number of person records following)
5. [HHWT](#) (Household weight)
6. [HHTYPE](#) (Household Type)
7. [CLUSTER](#) (Household cluster for variance estimation)
8. [STATEICP](#) (State (ICPSR code))
9. [COUNTYICP](#) (County (ICPSR code, identifiable counties only))
10. [METAREA](#) (Metropolitan area (pre-2013 delineations, identifiable areas only) [general version])
11. [METAREAD](#) (Metropolitan area (pre-2013 delineations, identifiable areas only) [detailed version])
12. [CITY](#) (City (identifiable cities only))
13. [STRATA](#) (Household strata for variance estimation)
14. [GQ](#) (Group quarters status)
15. [FARM](#) (Farm status)
16. [NMOTHERS](#) (Number of mothers in household)
17. [NFATHERS](#) (Number of fathers in household)
18. [PERNUM](#) (Person number in sample unit)
19. [PERWT](#) (Person weight)

20. [FAMUNIT](#) (Family unit membership)
21. [FAMSIZE](#) (Number of own family members in household)
22. [MOMLOC](#) (Mother's location in the household)
23. [MOMRULE_HIST](#) (Rule for linking mother)
24. [POPLOC](#) (Father's location in the household)
25. [POPRULE_HIST](#) (Rule for linking father)
26. [SPLOC](#) (Spouse's location in household)
27. [SPRULE_HIST](#) (Rule for linking spouse)
28. [NCHILD](#) (Number of own children in the household)
29. [NSIBS](#) (Number of own siblings in household)
30. [ELDCH](#) (Age of eldest own child in household)
31. [YNGCH](#) (Age of youngest own child in household)
32. [RELATE](#) (Relationship to household head [general version])
33. [RELATED](#) (Relationship to household head [detailed version])
34. [SEX](#) (Sex)
35. [AGE](#) (Age)
36. [BIRTHYR](#) (Year of birth)
37. [RACE](#) (Race [general version])
38. [RACED](#) (Race [detailed version])
39. [BPL](#) (Birthplace [general version])
40. [BPLD](#) (Birthplace [detailed version])
41. [VERSIONHIST](#) (Release version for historical full counts)
42. [NAMELAST](#) (Last name)
43. [NAMEFRST](#) (First name)
44. [HISTID](#) (Consistent historical data person identifier)

Variable: "YEAR"

Name:	YEAR
Label:	Census year
Variable Text:	YEAR reports the four-digit year when the household was enumerated or included in the census, the ACS, and the PRCS. For the multi-year ACS/PRCS samples, YEAR indicates the last year of data included (e.g., 2007 for the 2005-2007 3-year ACS/PRCS; 2008 for the 2006-2008 3-year ACS/PRCS; and so on). For the actual year of survey in these multi-year data, see MULTYEAR.

Variable: "SAMPLE"

Name:	SAMPLE
Label:	IPUMS sample identifier
Variable Text:	SAMPLE identifies the IPUMS sample from which the case is drawn. Each sample receives a unique 6-digit code. The codes are structured as follows: The first four digits are the year of the census/survey.

	The next two digits identify the sample within the year. For most censuses, IPUMS has multiple datasets which were constructed using different sampling techniques (i.e. size/demographic of the sample population, geographic coverage level or location, or duration of the sampling period for the ACS/PRCS samples). The availability table for each variable indicates whether that variable is available in only certain samples for a given year. For further discussion of sample differences, see "Sample Designs." Note: SAMPLE replaces DATANUM. Though the last two digits in SAMPLE do not correlate exactly with the now-deprecated DATANUM, the variable serves the same purpose of assigning a unique id to all cases that belong to the same dataset.

Variable: "SERIAL"

Name:	SERIAL
Label:	Household serial number
Variable Text:	SERIAL is an identifying number unique to each household record in a given sample. All person records are assigned the same serial number as the household record that they follow. (Person records also have their own unique identifiers - see PERNUM.) A combination of SAMPLE and SERIAL provides a unique identifier for every household in

	the IPUMS; the combination of SAMPLE, SERIAL, and PERNUM uniquely identifies every person in the database. For 1850-1930, households that are part of a multi-household dwelling can be identified by using the DWELLING and DWSEQ variables. See "Sample Designs" for further discussion of sampling from within multi-household dwellings.
Concept:	Technical Variables -- HOUSEHOLD
Start Position:	11
End Position:	18
Width:	8
Variable Format:	numeric
Implied Decimal Places:	0
Coder Instructions:	CodesSERIAL is an 8-digit numeric variable which assigns a unique identification number to each household record in a given sample (See PERNUM for the analogous person record identifier). A combination of SAMPLE and SERIAL provides a unique identifier for every household in the IPUMS; the combination of SAMPLE, SERIAL, and PERNUM uniquely identifies every person in the database. SERIAL specific variable codes for missing, edited, or unidentified observations, observations not applicable (N/A), observations not in universe (NIU), top and bottom value coding, etc. are provided below if applicable by Census year (and data sample if specified). SERIAL Specific Variable Codes

Variable: "NUMPREC"

Name:	NUMPREC
Label:	Number of person records following
Variable Text:	NUMPREC reports the number of person records that are included in the sampled unit. These person records all have the same serial number (SERIAL) as the household record. The information contained in the household record usually applies to all these persons.
Concept:	Technical Variables -- HOUSEHOLD
Start Position:	19
End Position:	20
Width:	2

Variable Format:	numeric
Implied Decimal Places:	0

Variable: "HHWT"

Name:	HHWT
Label:	Household weight
Variable Text:	HHWT indicates how many households in the U.S. population are represented by a given household in an IPUMS sample. It is generally a good idea to use HHWT when conducting a household-level analysis of any IPUMS sample. The use of HHWT is optional when analyzing one of the "flat" or unweighted IPUMS samples. Flat IPUMS samples include the 1% samples from 1850-1930, all samples from 1960, 1970, and 1980, the 1% unweighted samples from 1990 and 2000, the 10% 2010 sample, and any of the full count 100% census datasets. HHWT must be used to obtain nationally representative statistics for household-level analyses of any sample other than those. Users should also be sure to select one person (e.g., PERNUM = 1) to represent the entire household. For further explanation of the sample weights, see "Sample Designs" and "Sample Weights". See also PERWT for a corresponding variable at the person level, and SLWT for a weight variable used with sample-line records in 1940 1% and 1950.
Concept:	Technical Variables -- HOUSEHOLD
Start Position:	21
End Position:	30
Width:	10
Variable Format:	numeric
Implied Decimal Places:	2
Coder Instructions:	CodesHHWT is a 6-digit numeric variable which indicates how many households in the U.S. population are represented by a given household in an IPUMS sample and has two implied decimals. For example, a HHWT value of 010461 should be interpreted as 104.61. HHWT specific variable codes for missing, edited, or unidentified observations, observations not applicable (N/A), observations not in universe (NIU), top and bottom value coding, etc. are provided below if applicable by Census year (and data sample if specified). User Note: Users should also be sure to select one person (e.g., PERNUM = 1) to represent the entire household when using HHWT.

HHWT Specific Variable Codes

Variable: "HHTYPE"

Name:	HHTYPE
Label:	Household Type
Variable Text:	HHTYPE is a constructed variable that mirrors the household type variable that the Census Bureau created in its 2000 PUMS sample (see page 6-37 of the 2000 PUMS codebook). With HHTYPE, the IPUMS creates the variable consistently from 1940 onward. A future version of this variable will provide the same categories for all IPUMS samples. HHTYPE classifies all households as either family or nonfamily households. Family households are distinguished from nonfamily households using RELATE. A family household consists of a household head and one or more persons who are related to the household head by birth, marriage, or adoption and who are living together in the same household. According to the household head's SEX and MARST, family households are classified as either a married-couple family or a family headed by a man/woman without a spouse present. Family households with no spouse present include household heads of all marital statuses except married, spouse present (see MARST). Households where an unmarried partner is present are classified as family households only if there are other persons in the household who are related to the household head by birth, marriage, or adoption. Therefore, households containing only a household head and an unmarried partner are coded as nonfamily households. Nonfamily households are distinguished by the sex of the household head and the presence of other unrelated individuals (including partners) living in the household.
Concept:	Technical Variables -- HOUSEHOLD
Start Position:	31
End Position:	31
Width:	1
Variable Format:	numeric
Implied Decimal Places:	0

Categories

Value	Label
0	N/A
1	Married-couple family household

2	Male householder, no wife present
3	Female householder, no husband present
4	Male householder, living alone
5	Male householder, not living alone
6	Female householder, living alone
7	Female householder, not living alone
9	HHTYPE could not be determined

Variable: "CLUSTER"

Name:	CLUSTER
Label:	Household cluster for variance estimation
Variable Text:	CLUSTER is designed for use with STRATA in Taylor series linear approximation for correction of complex sample design characteristics. See the STRATA variable description for more details.
Concept:	Technical Variables -- HOUSEHOLD
Start Position:	32
End Position:	44
Width:	13
Variable Format:	numeric
Implied Decimal Places:	0
Coder Instructions:	CodesCLUSTER is an 11-digit numeric variable designed for use with STRATA in Taylor series linear approximation for correction of complex sample design characteristics (See the Description of STRATA for more details). CLUSTER specific variable codes for missing, edited, or unidentified observations, observations not applicable (N/A), observations not in universe (NIU), top and bottom value coding, etc. are provided below if applicable by Census year (and data sample if specified). CLUSTER Specific Variable Codes

Variable: "STATEICP"

Name:	STATEICP
Label:	State (ICPSR code)
Variable Text:	STATEICP identifies the state in which the housing unit was located, using the coding scheme developed by the Inter-University Consortium for Political and Social Research (ICPSR). The ICPSR scheme orders states first by geographic division and then alphabetically within each division. Note that the ICPSR geographic divisions do not correspond exactly with the census regions used in the IPUMS variable REGION. State or territory names represent that state or territory's contemporary political boundaries for a given year. Users should familiarize themselves with any historical changes in these boundaries that might affect their research. (Go here for year-by-year maps of states and territories in the U.S.) IPUMS assigns current state codes to territories that later became states; for example, Arizona Territory in 1880 and 1900 is given the Arizona state code (61). In 1880, Dakota Territory counties are split between areas that ultimately became North and South Dakota.

Variable: "COUNTYICP"

Name:	COUNTYICP
Label:	County (ICPSR code, identifiable counties only)
Variable Text:	IPUMS USA cannot identify most counties in recent samples. COUNTYICP identifies the county where the household was enumerated, using the Inter-University Consortium for Political and Social Research (ICPSR) coding scheme. COUNTYICP codes are state-dependent; they must be combined with state codes (see STATEICP or STATEFIP) to distinguish counties located in different states. Many county boundaries and some county names have changed over time. IPUMS does not impose a uniform county boundary system on the data, so each county listed for a given year in IPUMS should be assumed to have the boundaries that it had in that year. All counties are identified in 1850 to 1950 full count files. Counties are not identified in public-use microdata samples from 1950 onwards, so IPUMS instead identifies counties, where possible, from other low-level geographic identifiers. These include State Economic Areas (SEA) in the 1950 1% sample; county groups in 1970 samples (CNTYGP97) and 1980 samples (CNTYGP98); and Public Use Microdata Areas (PUMA) from 1990 onwards, including Super-PUMAs (PUMASUPR) in 2000. In 1950 and later samples (excluding the 1950 full count), COUNTYICP identifies a county if and only if: it was coterminous with a single SEA, county group, or PUMA; or it contained multiple SEAs, county groups, or PUMAs, none of which extended into other counties. List of counties identified in 1950 and later samples: Identified Counties, 1950-Forward For municipios, the Puerto Rican statistical equivalent of U.S. counties, see PRCOUNTA (alphabetic version) and PRCOUNTY (numeric version). ICPSR county codes are generally ordered alphabetically by county name within states. With a few exceptions, ICPSR codes correspond to 3-digit FIPS codes (as identified by COUNTYFIP) followed by an added zero digit. The fourth digit is used to accommodate the complete history of U.S. County definitions. FIPS codes were instituted around the time of the 1970 census, and historical counties that were dissolved before then have no FIPS code. For such counties, ICPSR generally appends a fourth digit of 5. Like STATEICP, COUNTYICP facilitates merging IPUMS data with ICPSR data. COUNTYICP also identifies areas that were not part of any county, including the independent cities of Virginia and some Indian lands. In multi-year ACS/PRCS samples that span different PUMA definitions, this variable is based on whichever PUMA definition is associated with the respondent's survey year (as given by MULTYEAR). This occurs only in the 2022 5-year samples and in multi-year samples that include both 2011 and 2012 survey years. For more information about how PUMA definitions vary within multi-year samples, see the PUMA variable description.

Variable: "METAREA"

Name:	METAREA
Label:	Metropolitan area (pre-2013 delineations, identifiable areas only) [general version]
Variable Text:	A metropolitan area, or metro area, is a region consisting of a large urban core together with surrounding communities that have a high degree of economic and social integration with the urban core. For residents of metro areas, METAREA identifies the metro area of residence, contingent on varying delineations of metro areas across time and on variations in available geographic information and in confidentiality restrictions among samples. METAREA is not available for 2012-onward ACS and PRCS samples or the 2010 census 10% sample. For information about variables that provide metro area codes for these samples, see the overview page: IPUMS USA Variables for Metropolitan Areas. User Caution: Incompletely Identified Metropolitan Areas In samples from 1960 to 2011 (excluding the 1970 and 1980 metro samples), METAREA only partially identifies the populations of many metro areas, and the unidentified portions can be considerably large, occasionally over 50%. Users should consult the Incompletely Identified Metropolitan Areas page, which lists the percent of each metro area's population that resided in excluded areas for each sample. The reason for incomplete coverage is that the source data for these samples include no specific information about metro areas. The most detailed geographic information available is for 1980 county groups or for PUMAs, areas which occasionally straddle official metro area boundaries. If any portion of a straddling area's population resided outside a single metro area, the METAREA variable uses a conservative assignment strategy and identifies no metro area for all residents of the straddling area. Users should not assume that the identified portion of a partly identified metro area is a representative sample of the entire metro area. In fact, because the unidentified population is located in areas that straddle the metro area boundaries, the identified population will often skew toward core populations and omit outlying communities. Also, weighted population counts for incompletely identified metro areas will be low by amounts ranging from 1 to 69% (since the unidentified individuals will not be counted as living in the metro area). Metropolitan Area Delineations Since 1950, the Bureau of the Budget (later renamed the Office of Management and Budget, or OMB), has produced and continually updated standard delineations of metropolitan areas for the U.S., defining each area as a county or a set of contiguous counties, or, for New England prior to 2003, as a set of cities or towns. In IPUMS samples for 1950 and later, the areas identified by METAREA generally correspond to contemporary OMB delineations, as were also used by the Census Bureau. For ACS samples through 2011, METAREA uses the 1999 OMB delineations, as were used for Census 2000 tabulations. To delineate metro areas in pre-1950 samples, the general approach (used first by the creators of the 1940 PUMS and then by IPUMS for earlier samples) is to apply the 1950 OMB standards to historical statistics. One deviation from the 1950 standards is that all pre-1950 delineations are county-based, even in New England. See the Comparability section for details on how delineations have changed over time and how confidentiality restrictions have affected METAREA's correspondence with standard delineations. For a listing of the counties associated with each metro area in each sample year, see the County Composition tables. For a complete record of OMB standards and changes since 1950, see the Census Bureau's historical delineations page. The METAREA Code System METAREA codes are based primarily on the 4-digit OMB codes of 1990 metropolitan areas but with adjustments to reflect hierarchical relationships among metro areas across time. For any group of metro areas that were at any time defined to be components of a single metro area together, the 4-digit METAREA codes were adjusted to use the same first 3 digits. E.g.,

the METAREA code for Fort Worth, TX, is 1921, which indicates that the area was, in some sample, included as part of the Dallas-Fort Worth, TX, metro area, which has a code of 1920. Similarly, in cases where the 1990 OMB codes of disjoint areas share the same first 3 digits, the METAREA codes were adjusted to be distinct through 3 digits. This system enables users to obtain relatively consistent samples for "top-level" metro areas across time by grouping records according to the first 3 METAREA digits.

However, when IPUMS assigned METAREA codes for the 2000 and ACS samples, the codes were not adjusted to reflect any new splits or mergers. E.g., between 1990 and 1999, the OMB delineations merged the Odessa and Midland, TX, metro areas (with codes of 5800 and 5040) into a single area (with a code of 5800). Maintaining the hierarchical structure of METAREA codes would have required changing some existing 1990-based codes (e.g., changing the Midland code from 5040 to 5801), but to maintain static codes for prior users of METAREA, no codes were changed. Therefore, the first 3 digits of METAREA codes do not consistently represent top-level groups for the 2000 and ACS samples.

The METAREA Label System

METAREA labels are generally based on the OMB names of 1990 metropolitan areas or on the standard names of other older areas that do not appear in the 1990 delineations. A METAREA label may include the names of any major central cities that were ever included in the identified area, including some cities that are associated with a different code in some samples. E.g., the METAREA code 1920 has a label of "Dallas-Fort Worth, TX," but in most samples, records for Fort Worth have a code of 1921 and not 1920.

This system ensures that the first label in each 3-digit METAREA group will properly describe the full extent of the general 3-digit code group, but it also causes ambiguities for the detailed 4-digit codes. In samples where a city name appears in the labels for 2 different codes, users should assume that the city is associated only with the higher-numbered code.

Alternative for Pre-1950 Samples: Metropolitan Districts

Prior to the introduction of the OMB's standard metropolitan areas in 1950, the Census Bureau had defined and tabulated statistics for metropolitan districts, which differ from metropolitan areas primarily in their use of minor civil divisions (cities, towns, etc.) as building blocks instead of counties. The METDIST variable identifies metropolitan districts for pre-1950 samples using criteria similar to those used by the Census in 1940. One advantage of METDIST relative to METAREA is that METDIST was constructed for the 1940 sample after confidentiality requirements were lifted for 1940 and is therefore more complete than METAREA for that year.

Variable: "METAREAD"

Name:	METAREAD
Label:	Metropolitan area (pre-2013 delineations, identifiable areas only) [detailed version]
Variable Text:	A metropolitan area, or metro area, is a region consisting of a large urban core together with surrounding communities that have a high degree of economic and social integration with the urban core. For residents of metro areas, METAREA identifies the metro area of residence, contingent on varying delineations of metro areas across time and on variations in available geographic information and in confidentiality restrictions among samples. METAREA is not available for 2012-onward ACS and PRCS samples or the 2010 census 10% sample. For information about variables that provide metro area codes for these samples, see the overview page: IPUMS USA Variables for Metropolitan Areas. User Caution: Incompletely Identified Metropolitan Areas In samples from 1960 to 2011 (excluding the 1970 and 1980 metro samples), METAREA only partially identifies the populations of many metro areas, and the unidentified portions can be considerably large, occasionally over 50%. Users should consult the Incompletely Identified Metropolitan Areas page, which lists the percent of each metro area's population that resided in excluded areas for each sample. The reason for incomplete coverage is that the source data for these samples include no specific information about metro areas. The most detailed geographic information available is for 1980 county groups or for PUMAs, areas which occasionally straddle official metro area boundaries. If any portion of a straddling area's population resided outside a single metro area, the METAREA variable uses a conservative assignment strategy and identifies no metro area for all residents of the straddling area. Users should not assume that the identified portion of a partly identified metro area is a representative sample of the entire metro area. In fact, because the unidentified population is located in areas that straddle the metro area boundaries, the identified population will often skew toward core populations and omit outlying communities. Also, weighted population counts for incompletely identified metro areas will be low by amounts ranging

from 1 to 69% (since the unidentified individuals will not be counted as living in the metro area).

Metropolitan Area Delineations

Since 1950, the Bureau of the Budget (later renamed the Office of Management and Budget, or OMB), has produced and continually updated standard delineations of metropolitan areas for the U.S., defining each area as a county or a set of contiguous counties, or, for New England prior to 2003, as a set of cities or towns. In IPUMS samples for 1950 and later, the areas identified by METAREA generally correspond to contemporary OMB delineations, as were also used by the Census Bureau. For ACS samples through 2011, METAREA uses the 1999 OMB delineations, as were used for Census 2000 tabulations.

To delineate metro areas in pre-1950 samples, the general approach (used first by the creators of the 1940 PUMS and then by IPUMS for earlier samples) is to apply the 1950 OMB standards to historical statistics. One deviation from the 1950 standards is that all pre-1950 delineations are county-based, even in New England.

See the Comparability section for details on how delineations have changed over time and how confidentiality restrictions have affected METAREA's correspondence with standard delineations. For a listing of the counties associated with each metro area in each sample year, see the County Composition tables. For a complete record of OMB standards and changes since 1950, see the Census Bureau's historical delineations page.

The METAREA Code System

METAREA codes are based primarily on the 4-digit OMB codes of 1990 metropolitan areas but with adjustments to reflect hierarchical relationships among metro areas across time. For any group of metro areas that were at any time defined to be components of a single metro area together, the 4-digit METAREA codes were adjusted to use the same first 3 digits. E.g., the METAREA code for Fort Worth, TX, is 1921, which indicates that the area was, in some sample, included as part of the Dallas-Fort Worth, TX, metro area, which has a code of 1920. Similarly, in cases where the 1990 OMB codes of disjoint areas share the same first 3 digits, the METAREA codes were adjusted to be distinct through 3 digits. This system enables users to obtain relatively consistent samples for "top-level" metro areas across time by grouping records according to the first 3 METAREA digits.

However, when IPUMS assigned METAREA codes for the 2000 and ACS samples, the codes were not adjusted to reflect any new splits or mergers. E.g., between 1990 and 1999, the OMB delineations merged the Odessa and Midland, TX, metro areas (with codes of 5800 and 5040) into a single area (with a code of 5800). Maintaining the hierarchical structure of METAREA codes would have required changing some existing 1990-based codes (e.g., changing the Midland code from 5040 to 5801), but to maintain static codes for prior users of METAREA, no codes were changed. Therefore, the first 3 digits of METAREA codes do not consistently represent top-level groups for the 2000 and ACS samples.

The METAREA Label System

METAREA labels are generally based on the OMB names of 1990 metropolitan areas or on the standard names of other older areas that do not appear in the 1990 delineations. A METAREA label may include the names of any major central cities that were ever included in the identified area, including some cities that are associated with a different code in some samples. E.g., the METAREA code 1920 has a label of "Dallas-Fort Worth, TX," but in most samples, records for Fort Worth have a code of 1921 and not 1920.

This system ensures that the first label in each 3-digit METAREA group will properly describe the full extent of the general 3-digit code group, but it also causes ambiguities for the detailed 4-digit codes. In samples where a city name appears in the labels for 2 different codes, users should assume that the city is associated only with the higher-numbered code.

Alternative for Pre-1950 Samples: Metropolitan Districts

Prior to the introduction of the OMB's standard metropolitan areas in 1950, the Census Bureau had defined and tabulated statistics for metropolitan districts, which differ from metropolitan areas primarily in their use of minor civil divisions (cities, towns, etc.) as building blocks instead of counties. The METDIST variable identifies metropolitan districts for pre-1950 samples using criteria similar to those used by the Census in 1940. One advantage of METDIST relative to METAREA is that METDIST was constructed for the 1940 sample after

	confidentiality requirements were lifted for 1940 and is therefore more complete than METAREA for that year.

Variable: "CITY"

Name:	CITY
Label:	City (identifiable cities only)
Variable Text:	CITY identifies the city of residence for households located in identifiable cities. The Comparability section provides a discussion of factors affecting which cities are identified and how well they are represented in each sample. The identified cities are generally consistent with U.S. Census "place" definitions. For an explanation and history of the concept, see Chapter 9 in the Census Bureau's Geographic Areas Reference Manual.
Concept:	Geographic Variables -- HOUSEHOLD
Start Position:	58
End Position:	61

Width:	4
Variable Format:	numeric
Implied Decimal Places:	0

Categories

Value	Label
0000	Not in identifiable city (or size group)
0001	Aberdeen, SD
0002	Aberdeen, WA

Variable: "STRATA"

Name:	STRATA
Label:	Household strata for variance estimation

Variable Text:	STRATA is designed for use with CLUSTER in Taylor series linear approximation for correction of complex sample design characteristics. While appropriate use of the sampling weights PERWT and HHWT allow users to produce correct point estimates (such as means and proportions), many researchers believe that additional statistical techniques are also necessary to produce correct standard errors and statistical tests that account for complex sample design. For further information on why and how to use STRATA and CLUSTER, see Analysis and Variance Estimation with the IPUMS . For more details on the mathematics behind this method, see Issues Concerning the Calculation of Standard Errors Using IPUMS Data Products .
Concept:	Technical Variables -- HOUSEHOLD
Start Position:	62
End Position:	73
Width:	12
Variable Format:	numeric
Implied Decimal Places:	0
Coder Instructions:	CodesSTRATA is a 12-digit numeric variable designed for use with CLUSTER in Taylor series linear approximation for correction of complex sample design characteristics. While appropriate use of the sampling weights PERWT and HHWT allow users to produce correct point estimates (such as means and proportions), many researchers believe that additional statistical techniques are also necessary to produce correct standard errors and statistical tests that account for complex sample design. STRATA specific variable codes for missing, edited, or unidentified observations, observations not applicable (N/A), observations not in universe (NIU), top and bottom value coding, etc. are provided below if applicable by Census year (and data sample if specified). User Note: For further information on why and how to use STRATA and CLUSTER, see Analysis and Variance Estimation with the IPUMS. For more details on the mathematics behind this method, see Issues Concerning the Calculation of Standard Errors Using IPUMS Data Products. STRATA Specific Variable Codes

Variable: "GQ"

Name:	GQ
Label:	Group quarters status
Variable Text:	GQ classifies all housing units as falling into one of three main categories: households, group quarters, or vacant units. It also identifies fragmentary sample units for 1850-1930 (see below). In all years, the data available about a person and their co-residents depend on whether the person lives in a household or in group quarters. Households are sampled as units, meaning that everyone in the household is included in the sample, and most

	household-level variables are available. People living in group quarters are generally sampled as individuals; other people in their unit may or may not be included in the sample, and there is no way of linking co-residents' records to one another. If, however, a sampled person in group quarters was living with relatives, the related group was sampled for 1850-1930. Most household-level variables are not available for group quarters or for vacant units. Group quarters are largely institutions and other group living arrangements, such as rooming houses and military barracks. The definitions vary from year to year, but the pre-1940 samples have generally used a definition of group quarters that includes units with 10 or more individuals unrelated to the householder. See the comparability discussion below and "Sample Designs" for more details about changing definitions of group quarters. Group-quarters types are identified in further detail by GQTYPE and GQFUNDS.

Variable: "FARM"

Name:	FARM
-------	------

Label:	Farm status
Variable Text:	FARM identifies farm households. All group quarters are coded as non-farm, as are all housing units defined as outside the universe for FARM, above. User caution: Due to the way that IPUMS splits Group Quarters with 60+ residents, some people with missing FARM information have been incorrectly allocated farm status. A fix for this error is underway. In the meantime, users can correct this programmatically by changing the value from FARM=2 to FARM=1 where QFARM=4 and SPLIT=1.

Variable: "NMOTHERS"

Name:	NMOTHERS
Label:	Number of mothers in household
Variable Text:	NMOTHERS is a constructed variable that uses MOMLOC and MOMLOC2 to count the number of women within each unit who are identified as residing with their children. Units with no mothers present are coded "0." MOMLOC2 is only available in samples 1970 and later. For persons in households, NMOTHERS indicates the number of identified mothers in the household; for persons in group quarters in the period before 1940, NMOTHERS

	indicates the number of identified mothers in any group of related individuals. The universe for this variable from 1850 to 1930 and the 1940 100% dataset is all sample units, which relies on SAMPRULE. Additionally, the universe for this variable in the 1910-1920 Puerto Rican censuses is SAMPRULE not equal to 4.

Variable: "NFATHERS"

Name:	NFATHERS
Label:	Number of fathers in household
Variable Text:	NFATHERS is a constructed variable that uses POPLOC and POPLOC2 to count the number of men within each unit who are identified as residing with their children. Units with no fathers present are coded "0." POPLOC2 is only available in samples 1970 and later. For persons in households, NFATHERS indicates the number of identified fathers in the household; for persons in group quarters in the period before 1940, NFATHERS indicates the number of identified fathers in any group of related individuals. The universe for this variable from 1850 to 1930 and the 1940 100% dataset is all sample units, which relies on SAMPRULE. Additionally, the universe for this variable in the 1910-1920 Puerto Rican censuses is SAMPRULE not equal to 4.

Variable: "PERNUM"

Name:	PERNUM
Label:	Person number in sample unit
Variable Text:	PERNUM numbers all persons within each household consecutively in the order in which they appear on the original census or survey form. When combined with SAMPLE and SERIAL, PERNUM uniquely identifies each person within the IPUMS.
Concept:	Technical Variables -- PERSON
Start Position:	78
End Position:	81
Width:	4
Variable Format:	numeric
Implied Decimal Places:	0
Coder Instructions:	CodesPERNUM is a 4-digit numeric variable which numbers all persons within each household consecutively in the order in which they appear on the original census or survey form. PERNUM specific variable codes for missing, edited, or unidentified observations, observations not applicable (N/A), observations not in universe (NIU), top and bottom value coding, etc. are provided below if applicable by Census year (and data sample if specified).

Variable: "PERWT"

Name:	PERWT
Label:	Person weight
Variable Text:	PERWT indicates how many persons in the U.S. population are represented by a given person in an IPUMS sample. It is generally a good idea to use PERWT when conducting a person-level analysis of any IPUMS sample. The use of PERWT is optional when analyzing one of the "flat" or unweighted IPUMS samples. Flat IPUMS samples include the 1% samples from 1850-1930, all samples from 1960, 1970, and 1980, the 1% unweighted samples from 1990 and 2000, the 10% 2010 sample, and any of the full count 100% census datasets. PERWT must be used to obtain nationally representative statistics for person-level analyses of any sample other than those.

	For further explanation of the sample weights, see "Sample Designs" and "Sample Weights". See also HHWT for a corresponding variable at the household level, and SLWT for a weight variable used with sample-line records in 1940 and 1950.
Concept:	Technical Variables -- PERSON
Start Position:	82
End Position:	91
Width:	10
Variable Format:	numeric
Implied Decimal Places:	2
Coder Instructions:	CodesPERWT is a 6-digit numeric variable which indicates how many persons in the U.S. population are represented by a given person in an IPUMS sample and has two implied decimals. For example, a PERWT value of 010461 should be interpreted as 104.61. PERWT specific variable codes for missing, edited, or unidentified observations, observations not applicable (N/A), observations not in universe (NIU), top and bottom value coding, etc. are provided below if applicable by Census year (and data sample if specified). PERWT Specific Variable Codes

Variable: "FAMUNIT"

Name:	FAMUNIT
Label:	Family unit membership
Variable Text:	FAMUNIT indicates to which family within the housing unit each person belongs. If there is only one group of related individuals, all of them will be coded 1; if there is a second, separate such group, all members of that family group will be coded 2, and so on. All persons with a RELATE code less than 1100 are included in FAMUNIT, coded as 1. It is possible for an individual with a RELATE code larger than 1100 to be included in the "primary family" if they are identified as a child or spouse of a primary family member using SPLOC, MOMLOC, or POPLOC. The Census Bureau defines "primary families" as groups of persons related to the head of household, and "primary individuals" as household heads/householders residing without kin. In the IPUMS, primary families and primary individuals are identified in FAMUNIT with a code of 1; each secondary family or secondary individual receives a higher code. Note that IPUMS primary families (FAMUNIT=1) may also include individuals that the Census Bureau does not consider to be in the primary family if they are linked to someone related to the household head by SPLOC, MOMLOC, or POPLOC. For example, IPUMS links unmarried partners of the head to the household head using SPLOC and so these partners will be included in the IPUMS primary family unit, but because they are not related by blood or marriage to the household head, they will not be included in the Census Bureau's primary family unit. To recreate the Census Bureau's definition of the primary family, users can select only those individuals in the IPUMS primary family whose RELATE value is less than or equal to 1100. FAMUNIT is not analogous to the Census Bureau concept of "subfamily." People in Census

	Bureau "subfamilies" are necessarily related to the householder, and they will be included in FAMUNIT, coded as 1.

Variable: "MOMLOC"

Name:	MOMLOC
Label:	Mother's location in the household
Variable Text:	MOMLOC is a constructed variable that indicates whether the person's mother lived in the same household and, if so, gives the person number of the mother (PERNUM). The method by which probable child-mother links are identified is described in MOMRULE for samples from 1970 to present and in MOMRULE_HIST for samples prior to 1970.

	MOMLOC makes it easy for researchers to link the characteristics of children and their (probable) mothers. In 2017, the family interrelationship variables for samples from 1970 to present were revised to increase comparability across IPUMS projects and include same-sex couples. Many researchers who are familiar with the previous version of family interrelationship variables will find it useful to read a brief overview of the key differences of the New IPUMS Family Interrelationship Variables. On this page you'll find information on how family interrelationship variables are constructed, common uses of these variables, and specific examples of how these variables can be used efficiently. Samples prior to 1970 continue to use the original version of family interrelationship variables. User Caution: MOMLOC identifies social relationships (such as stepmother and adoptive mother) as well as biological relationships. For 1970 and later, MOMLOC will also identify the unmarried partner of a child's father identified with POPLOC. If the person identified with MOMLOC has a spouse or partner identified through SPLOC, the spouse or partner will also be identified as a parent through POPLOC (if a different-sex couple) or MOMLOC2 (if a same-sex couple). POPRULE and MOM2RULE will communicate the method through which those relationships are identified. The original version of MOMLOC and other IPUMS pointer variables are available for 1970 to present here.
Concept:	Family Interrelationship Variables -- PERSON
Start Position:	96
End Position:	97
Width:	2
Variable Format:	numeric
Implied Decimal Places:	0
Coder Instructions:	Codes00 = No mother of this person in the household.

Variable: "MOMRULE_HIST"

Name:	MOMRULE_HIST
Label:	Rule for linking mother
Variable Text:	MOMRULE_HIST reports why the IPUMS variable MOMLOC linked the person to a probable mother prior to 1970. The IPUMS establishes mother-child links according to seven basic rules, and MOMRULE_HIST reports the number of the rule for the link in question. If a link could be made according to more than one rule, the lowest-numbered rule was applied. See also MOMLOC, STEPMOM, "Family Interrelationships", and New IPUMS Family Interrelationship Variables for more information.

The following codes are included in MOMRULE_HIST:

0 = No mother of this person present in the household.

1 = Unambiguous relationship, based upon relationships to the head of household as listed on the form (see RELATE), or based on imputed relationship (IMPREL) for 1850-1870. This covers three basic cases:

a) a person listed as a son or daughter is linked to a person listed as wife/spouse or female head.

b) a person listed as head, brother, or sister is linked to a person listed as mother.

c) a person listed as wife, brother-in-law, or sister-in-law is linked to a person listed as mother-in-law.

2 = Persons listed as grandchildren are linked to the most proximate preceding (on the form) ever-married daughter, unmarried daughter (if immediately followed by a grandchild), or daughter-in-law of the head, if the daughter/daughter-in-law is 11-59 years older than the grandchild. If no link is formed with a preceding female, the program looks for the most proximate subsequent female who satisfies the same criteria.

3 = Other persons are linked to any preceding ever-married female who is 15-49 years older, so long as:

a) the two persons have listed (or imputed, for 1850-1870) relationships to the head that, when compared with one another, make a child-mother link plausible,

b) there are no persons listed between the potential child and mother, except the potential mother's other children or husband, and

4 = Same as rule 3, but surname similarity overrides part b of rule 3. If more than one potential mother is found in this way, the most proximate preceding female is linked. This rule can be applied only to samples with surname codes: 1850 to 1950.

5 = Same as rule 2, except evidence on children-ever-born (or children surviving for 1900 and 1910) overrides the potential mother's lack of "ever-married" status. This rule can be applied only to samples with children-ever-born or children surviving information: the 1900, 1910 (U.S. and Puerto Rican), and 1960.

6 = Same as rule 3, except evidence on children-ever-born (or children surviving for 1900 and 1910) overrides the potential mother's lack of "ever-married" status. Like rule 5, this rule can be applied only to the 1900, 1910 (U.S. and Puerto Rican), and 1960.

7= If the child is already linked to a father (see POPLOC and POPRULE), and that father has a wife present in the household who has not been linked to the child by another rule, the wife is linked to the child as a stepmother, regardless of the age gap between child and the stepmother.

The IPUMS performs the following consistency checks:

If a husband and wife were both linked to the same mother, the IPUMS chose the best mother link based on detailed relationship, surname, and proximity within the household, as listed on the form.

If both parents were present but they were not married to each other, the IPUMS unlinked the mother if her surname did not match that of the child. For years that lack surname (the 1960 Censuses), the least proximate parent was unlinked (i.e., was presumed not to be the biological parent).

Variable: "POPLOC"

Name:	POPLOC
Label:	Father's location in the household
Variable Text:	POPLOC is a constructed variable that indicates whether the person's father lived in the same household and, if so, gives the person number of the father (PERNUM). The method by which probable child-father links are identified is described in POPRULE for samples from 1970 to present and in POPRULE_HIST for samples prior to 1970. POPLOC makes it easy for researchers to link the characteristics of children and their (probable) father. In 2017, the family interrelationship variables for samples from 1970 to present were revised to increase comparability across IPUMS projects and include same-sex couples. Many researchers who are familiar with the previous version of family interrelationship variables will find it useful to read a brief overview of the key differences of the New IPUMS Family Interrelationship Variables. On this page you'll find information on how

	family interrelationship variables are constructed, common uses of these variables, and specific examples of how these variables can be used efficiently. Samples prior to 1970 continue to use the original version of family interrelationship variables. User Caution: POPLOC identifies social relationships (such as stepfather and adoptive father) as well as biological relationships. For 1970 and later, POPLOC will also identify the unmarried partner of a child's mother identified with MOMLOC. If the person identified with POPLOC has a spouse or partner identified through SPLOC, the spouse or partner will also be identified as a parent through MOMLOC (if a different-sex couple) or POPLOC2 (if a same-sex couple). MOMRULE and POP2RULE will communicate the method through which those relationships are identified. The original version of POPLOC and other IPUMS pointer variables are available for 1970 to present here.
Concept:	Family Interrelationship Variables -- PERSON
Start Position:	99
End Position:	100
Width:	2
Variable Format:	numeric
Implied Decimal Places:	0
Coder Instructions:	Codes00 = No father of this person in the household.

Variable: "POPRULE_HIST"

Name:	POPRULE_HIST
Label:	Rule for linking father
Variable Text:	POPRULE_HIST reports why the IPUMS variable POPLOC linked the person to a probable father for samples prior to 1970. IPUMS establishes father-child links according to five basic rules, and POPRULE_HIST reports the number of the rule for the link in question. If a link could be made according to more than one rule, the lowest-numbered rule was applied. See also POPLOC, STEPPOP , "Family Interrelationships" , and

New IPUMS Family Interrelationship Variables

for more information.

The following codes are included in POPRULE_HIST:

0 = No father of this person present in household.

1 = Unambiguous relationship, based upon relationships to the head of household as listed on the form (see

RELATE

), or based on imputed relationship (

IMPREL

) for 1850-1870. This covers three basic cases:

a) a person listed as a son or daughter is linked to the person listed as the head or the spouse of the female head.

b) a person listed as head, brother, or sister is linked to the person listed as father.

c) a person listed as wife, brother-in-law, or sister-in-law is linked to a person listed as father-in-law.

2 = Persons listed as grandchildren are linked to the most proximate preceding (on the form) ever-married son, an unmarried son (if immediately followed by the grandchild), or son-in-law of the head, if the son/son-in-law is 15-79 years older than the grandchild. If no link is formed with a preceding male, the program looks for the most proximate subsequent male who satisfies these criteria.

3 = Other persons are linked to any preceding ever-married male who is 15-64 years older, so long as:

a) the two persons have listed (or imputed, for 1850-1870) relationships to the head that, when compared with one another, make a child-father link plausible,

b) there are no persons listed between the potential child and father, except the potential father's other children or wife, and

4 = Same as rule 3, but surname similarity overrides the second part of rule 3. If more than one potential father is found in this way, the most proximate preceding male is linked. This rule can be applied only to samples with surname codes: 1850 to 1950.

7 = If the child is already linked to a mother (see

MOMLOC

and

MOMRULE

), and that mother has a husband present in the household who has not been linked to the child by another rule, the husband is linked to the child as a stepfather, regardless of the age gap between the child and the stepfather.

The IPUMS performs the following consistency checks:

	If the child was linked to a father and mother who were not married to one another, the IPUMS unlinked the father. If a husband and wife were both linked to the same father, the IPUMS chose the best parental link, based on detailed relationship, surname, and proximity within the household, as listed on the form. If both parents were present but they were not married to each other, the IPUMS unlinked the father if his surname did not match that of the child. For years that lack surname information (the 1960 Census), the least proximate parent was unlinked (i.e., was presumed not be the biological parent).

Variable: "RELATE"

Name:	RELATE
Label:	Relationship to household head [general version]
Variable Text:	RELATE describes an individual's relationship to the head of household or householder. Beginning in 1880, data on household relationship was asked of every person. The general relationship code is reasonably comparable across years. The detailed code makes distinctions that cannot be made in all years. The relationship codes are divided into two categories: relatives (codes 1-10) and non-relatives (codes 11-13). In general, the codes for relatives are self-explanatory. The non-relative codes are divided into three groups: "Partner, Friend, Visitor," roughly described as persons who do not pay or work for their accommodations (unless they share ownership); "Other Non-Relatives," including those persons paying or working for accommodations; and "Institutional Inmates." See the comparability discussion for further information about the coding scheme. RELATE is not available for 1850-1870, but the IPUMS variable IMPREL produces similar results. As a convenience, the extract system is set up so that users may include RELATE in extracts of the 1850-1870 samples. In those years, RELATE contains the information that is documented in the IMPREL variable description.

Coder Instructions:	CodesBIRTHYR is a 4-digit numeric code reporting the respondent's year of birth. BIRTHYR specific variable codes for missing, edited, or unidentified observations, observations not applicable (N/A), observations not in universe (NIU), top and bottom value coding, etc. are provided below by Census year (and data sample if specified). User Note: Researchers should use this variable with caution (See Comparability) BIRTHYR Specific Variable Codes 9996 = not classified 9997 = illegible 9998 = unknown 9999 = missing/blank

Variable: "RACE"

Name:	RACE
Label:	Race [general version]
Variable Text:	The concept of race has changed over the more than 150 years represented in IPUMS. Currently, the Census Bureau and others consider race to be a sociopolitical construct, not a scientific or anthropological one. Many detailed RACE categories consist of national origin groups. With the exception of the 1970-1990 Puerto Rican censuses, RACE was asked of every person in all years. Beginning in 2000, the race question changed substantially to allow respondents to report as many races as they felt necessary to describe themselves. In earlier years, only one race response was coded. Beginning in 2020, the Census Bureau updated the questionnaire text, processing, and coding of the race and Hispanic origin questions, resulting in major changes to the distribution of race and Hispanic origin categories. As a result, users should proceed with caution when comparing RACE and HISPAN in 2019-prior samples with 2020-onward samples. More improvements made to the race question in 2020 were implemented in 2023. See the comparability tab for more details. IPUMS offers several variables describing the answer(s) to the race question. RACE provides the full detail given by the respondent and/or released by the Census Bureau; it is not always historically compatible (see comparability discussion below). Users primarily interested in historical compatibility should consider using RACHSING. RACHSING codes race and Hispanic origin responses into a simple, historically compatible scheme that includes only federally defined race and Hispanic origin groups. Please note that RACESING, an earlier version of RACHSING, is also available on the IPUMS website. In addition, specific combinations of major races can be discerned using the following bivariate indicators of whether a particular race group was reported: RACAMIND, RACASIAN, RACBLK, RACOTHER, RACPACIS, and RACWHT. RACNUM indicates the total number of major race groups reported for an individual. The information contained in the bivariate indicators and in RACNUM is integrated into the detailed version of RACE. Prior to 1960, the census enumerator was responsible for categorizing persons and was not specifically instructed to ask the individual his or her race. In 1970 and later years, an individual's race was reported by someone in the household or group quarters. In the 1990 U.S. census, the 2000 U.S. and Puerto Rican censuses, the ACS, and the PRCS respondents were specifically asked what race the person "considers himself/herself" to be, although such self-description was more or less operative since 1960. User Note: Race questions were not asked in the Puerto Rican censuses of 1970, 1980, and 1990. They were asked in the 1910 and 1920 Puerto Rican censuses, the 2000-2010 Puerto Rican censuses, and the PRCS.

Variable: "VERSIONHIST"

Name:	VERSIONHIST
-------	-------------

Label:	Release version for historical full counts
Variable Text:	The variable VERSIONHIST identifies the public-release version of a full count dataset. For more information, see the IPUMS Full Count page. This variable was implemented in the Fall of 2019, beginning with the 1860 and 1870 complete count datasets.
Concept:	Historical Technical Variables -- PERSON
Start Position:	137
End Position:	138
Width:	2
Variable Format:	numeric
Implied Decimal Places:	0

Categories

Value	Label
01	Public release version 1
02	Public release version 2
03	Public release version 3

Variable: "NAMELAST"

Name:	NAMELAST
Label:	Last name
Variable Text:	NAMELAST is an alphabetic variable reporting the person's last name, as recorded by the enumerator on the census form. A question mark embedded in a name indicates an illegible character. A question mark and space preceding a name means the entry was difficult to read and the name is the best interpretation possible. An exclamation point indicates that the entire entry was illegible. An asterisk indicates that the field was blank.
Concept:	Historical Technical Variables -- PERSON
Start Position:	139

End Position:	209
Width:	71
Variable Format:	character
Implied Decimal Places:	0
Coder Instructions:	CodesNAMELAST is a string variable which reports the person's last name, as recorded by the enumerator on the census form. A question mark embedded in a name indicates an illegible character. A question mark and space preceding a name means the entry was difficult to read and the name is the best interpretation possible. An exclamation point indicates that the entire entry was illegible. An asterisk indicates that the field was blank. NAMELAST specific variable codes for missing, edited, or unidentified observations, observations not applicable (N/A), observations not in universe (NIU), top and bottom value coding, etc. are provided below if applicable by Census year (and data sample if specified).

Variable: "NAMEFRST"

Name:	NAMEFRST
Label:	First name
Variable Text:	NAMEFRST is an alphabetic variable reporting the person's first name, as recorded by the enumerator on the census form. Middle initials and middle names follow the first name, if the enumerator recorded them. A question mark embedded in a name indicates an illegible character. A question mark and space preceding a name means that the entry was difficult to read, and the name is the best interpretation possible. An exclamation point indicates that the entire entry was illegible. An asterisk indicates that the field was blank.
Concept:	Historical Technical Variables -- PERSON
Start Position:	210
End Position:	282
Width:	73
Variable Format:	character
Implied Decimal Places:	0

Coder Instructions:	CodesNAMEFRST is an alphabetic string variable which reports the person's first name, as recorded by the enumerator on the census form. A question mark embedded in a name indicates an illegible character. A question mark and space preceding a name means the entry was difficult to read and the name is the best interpretation possible. An exclamation point indicates that the entire entry was illegible. An asterisk indicates that the field was blank. NAMEFRST specific variable codes for missing, edited, or unidentified observations, observations not applicable (N/A), observations not in universe (NIU), top and bottom value coding, etc. are provided below if applicable by Census year (and data sample if specified).
---------------------	--

Variable: "HISTID"

Name:	HISTID
Label:	Consistent historical data person identifier
Variable Text:	HISTID is a consistent individual-level identifier. The variables SERIAL and PERNUM uniquely identify individuals within a dataset. However, the specific respondents associated with those unique values can change as historical full count datasets are improved. HISTID allows researchers to track specific individuals regardless of any such changes as it is a unique identifier independent of household and position within household. Researchers can then merge their existing data with newer versions of the data file using HISTID and identify updates, corrections, or improvements that may have been applied to the data.
Concept:	Historical Technical Variables -- PERSON
Start Position:	283
End Position:	318
Width:	36
Variable Format:	character
Implied Decimal Places:	0
Coder Instructions:	CodesHISTID is a 36-character, consistent individual-level identifier.
